High-dimensional Vectorized Embeddings

- Core element of the vast majority of machine learning tasks.
- Facilites learning, understanding concepts, and efficiently representing feature spaces.

• Mapped vector representations of data entities in high-dimension.

| Introduction 00000000 | Background 000000000 | Our Proposed Method | Results 000000 | Conclusion 00 | Future Work |

• Self-supervised learning approach

a

• Effectively convey the meaning and structural relationships present in the input data.

| Introduction 00000000 | Background 000000000 | Our Proposed Method | Results 000000 | Conclusion 00 | Future Work |
|--------------------------|-------------------------|---------------------|-------------------|------------------|-------------|
| | | | | | |

Challenges in High-dimension

- Difficult to think about or conceptualize the structure of embeddings in high-dimension.
- This makes analyzing and obtaining meaningful patterns within the embeddings difficult.

| Introduction | Background | Our Proposed Method | Results | Conclusion | Future Work |
|--------------|------------|---------------------|---------|------------|-------------|
| 000000000 | 000000000 | | 000000 | 00 | 0000 |
| | | | | | |

Inherent Challenges Associated with Embeddings

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Way Forward: Geometric Approaches

- Despite these challenges, there are existing geometric techniques that can be used to gain insights and extract meaningful information from high-dimensional embeddings:
 - \star Defining a basis
 - * Spectral structure through Eigen-Decomposition
 - ⋆ Normalization
- These techniques permit us to consider the geometry of these vectorized high-dimensional embeddings more appropriately.

|---------------------------|-------------------------|---------------------|-------------------|------------------|-------------|
| | | | | | |

Way Forward: Geometric Approaches

• Consequently, understanding the underlying geometrical structure of the high-dimensional vectorized embedding is of great interest.

AI Safety

Is it real or made by AI? Europe wants a label for that as it fights disinformation

The European Union is pushing online platforms like Google and Meta to step up efforts to fight false information by adding labels to text, photos and other content generated by artificial intelligence

Bias Amplification in ChatGPT

Source: https://textio.com/blog/chatgpt-writes-job-posts/99089591200

02-03-23 | WORKPLACE EVOLUTION

We asked ChatGPT to write performance reviews and they are wildly sexist (and racist)

Textio's cofounder Kieran Snyder observes that it takes so little for ChatGPT to start baking gendered assumptions into otherwise highly generic feedback.

"Name 10 philosophers"

| Our Prop | osed Meth | od | | | |

- In this work, we propose a new mechanism to augment a word vector embedding representation that offers:
 - ★ improved bias removal while retaining the concept information
 ★ resulting in the interpretability of the representation.

• We build on top of Orthogonal Subspace Correction and Rectification (OSCaR)

|---------------------------|-------------------------|---------------------|-------------------|------------------|-------------|
| Conclusi | on | | | | |

- We introduced a new mechanism for augmenting vectorized embedding representations, namely Iterative Subspace Rectification (ISR)
- Our approach:
 - $\star\,$ Offers improved bias removal while retaining the key concept information
 - \star Can be extended to multiple concept subspaces
 - Explicitly encodes concepts along the coordinate axis, making the resulting representations Interpretable
